Acknowledgments

The author is grateful especially to Namkee Ahn, Alberto Alesina, Panu Poutvaara, Monica Queisser, Ernesto Villanueva and participants at several conferences and seminars for their comments. The usual caveat applies.

Slightly modified Chapter 2 has been awarded the SIEP 2002 prize for young authors. The author acknowledges financial support from Fundacion Rammon Areces. Part of this thesis was written while the author was at the Spanish Prime Minister's Economic Bureau.

Abstract

The abstract should concisely summarize the contents of a thesis. Since potential readers should be able to make their decision on the personal relevance based on the abstract, the abstract should clearly tell the reader what information he can expect to find in the thesis. The most essential issue is the problem statement and the actual contribution of described work. The authors should always keep in mind that the abstract is the most frequently read part of a thesis. It should contain at least 70 and at most 120 words (200 when you are writing a thesis). Do not cite anyone in the abstract.

Proposed topic The Price Elasticity of Gasoline Demand: A Meta-

Analysis

Motivation For the purposes of government policy concerning energy security, optimal taxation, and climate change, precise estimates of the price elasticity of gasoline demand are of principal importance. For example, if gasoline demand is highly price-inelastic, taxes will be ineffective in reducing gasoline consumption and the corresponding emissions of greenhouse gases. During the last 30 years the topic has attracted a lot of attention of economists who produced a plethora of empirical estimates of both short- and long-run price elasticities. Yet the estimates vary broadly.

A systematic method how to make use of all this work is to collect these numerous estimates and summarize them quantitatively. The method is called meta-analysis (Stanley, 2001) and has long been used in economics following the seminal contribution by Stanley and Jarrell (1989). Recent applications of meta-analysis in economics include, among others, Card et al. (2010) on the evaluation of active labor market policy, Havranek (2010) on the trade effect of currency unions, and Horvathova (2010) on the impact of environmental performance on corporate financial performance.

Two international meta-analyses of the elasticity of gasoline demand have been conducted (Brons et al., 2008; Espey, 1998). These meta-analyses study carefully the causes of heterogeneity observed in the literature. The average short- and long-run elasticities found by these meta-analyses were -0.26 and -0.58 (Espey, 1998) and -0.34 and -0.84 (Brons et al., 2008). None of the meta-analyses, however, corrected the estimates for publication bias. It is well-known that publication selection can seriously bias the estimates of price elasticities because positive estimates are usually inconsistent with theory: for instance, Stanley (2005) documents how the price elasticity of water demand is exaggerated fourfold because of publication bias.

Hypotheses

Hypothesis #1: The literature estimating gasoline demand elasticities is affected by publication bias.

Hypothesis #2: The publication bias exaggerates the mean reported elasticity.

Hypothesis #3: The extent of publication bias decreases in time.

Methodology The first step of meta-analysis is the collection of primary studies. I will examine all studies used by the most recent meta-analysis (Brons et al., 2008), but because the sample used by Brons et al. (2008) ends in 1999, I will additionally search the EconLit and Scopus databases for new studies published. To be able to use modern meta-analysis methods and correct for publication bias, I need the standard error of each estimate of elasticity; therefore I will have to exclude studies that do not report standard errors (or any other statistics from which standard errors could be computed). Concerning the definition of short- and long-term elasticity estimates, I will follow the approach described in the first meta-analysis on this topic, Espey (1998).

In the absence of publication bias the estimates of elasticities are randomly distributed around the true mean elasticity. Nevertheless, if some estimates end in the "file drawer" (Rosenthal, 1979) because they are insignificant or have a positive sign, the reported estimates will be correlated with their standard errors (Ashenfelter et al., 1999; Card and Krueger, 1995). For example, if a statistically significant effect is required, an author who has few observations may run a specification search until the estimate becomes large enough to offset the high standard errors. In this specification the regression coefficient corresponding to the standard error measures the magnitude of publication bias and the intercept measures the magnitude of the elasticity corrected for publication bias (thus, the specification directly addresses hypotheses 1 and 2). Because such a regression is likely heteroscedastic (the explanatory variable is a sample estimate of the standard deviation of the response variable), in practice it is usually estimated by weighted least squares with the inverse of standard errors (precision) taken as weights.

In meta-analysis I have to take into consideration that estimates coming from one study are likely to be dependent. A common way how to cope with this problem is to employ the mixed-effects multilevel model (Doucouliagos and Stanley, 2009), which allows for unobserved between-study heterogeneity. Between-study heterogeneity is likely to be substantial since in our case the primary studies use data from different countries. I will specify the model following Havranek and Irsova (2011): the overall error term now breaks down into study-level random effects and estimate-level disturbances. To address hypothesis 3 I will add an interaction term between the

year of publication of the study and the reported standard error. I expect that the magnitude of publication bias to decrease in time, which would be in line with the economics-research-cycle hypothesis (Goldfarb, 1995; Stanley et al., 2008).

Expected Contribution I will conduct a quantitative survey of journal articles estimating the price elasticity of gasoline demand. In contrast to previous meta-analyses on this topic, I will take into account publication selection bias using the mixed-effects multilevel meta-regression. Publication bias in this area is expected to be strong; when I correct for the bias, I expect to obtain estimates of short- and long-run elasticities that are much smaller than the results of the previously published meta-analyses and also to the simple mean of all estimates in my sample of literature. The estimates can be directly used in fiscal modeling (calculating the optimal tax on gasoline) and climate change policy (for example, the computation of the social cost of carbon emissions).

Outline

- 1. Motivation: there are meta-analyses on the price elasticity of gasoline demand, but they do not correct their estimates for publication bias. Publication bias has been shown to distort most areas of empirical economics, so there is a good chance it will be important here as well.
- 2. Studies on gasoline demand: I will briefly describe how people estimate the price elasticity of gasoline demand.
- 3. Data: I will explain how I will collect estimates from studies estimating the elasticity.
- 4. Methods: I will explain modern meta-analysis methods, including the funnel asymmetry test, precision effect test, and multilevel variants of these regressions.
- 5. Results: I will discuss my baseline regressions and robustness checks.
- Concluding remarks: I will summarize my findings and their implications for policy and future research.

Author	Supervisor

Introduction

This document serves two purposes. First, it is a template and example for a master's thesis. Second, the text in all sections contains some useful information on structuring and writing your thesis.

The introduction should consist of three parts (as paragraphs, not to be structured into multiple headings): The first part deals with the background of the work and describes the field of research. It should also elaborate on the general problem statement and the relevance. The second part should describe the focus of the thesis, typically the paragraph starts with a phrase like "The objective of this thesis is ...".

The last part should describe the structure of the thesis, for instance in the following manner. The thesis is structured as follows: Chapter 2 gives some hints on basic formatting features and covers also acronyms, figures, boxes and tables. Chapter 3 covers the usage of first person singular in academic writing. Chapter 4 gives a recommendation on the usage of hyphens in English language in LATEX and explains how to use the itemize and quote environments. Chapter 5 presents a checklist of common mistakes to avoid. Chapter 6 shows a few enumerate-based environments and contains numerous hints. Chapter 7 summarizes our findings.

2.6 Theorems, Definitions, ...

Definition 2.1 (My original definition). This is a definition.

Assumption 2.1 (My realistic assumption). This is an assumption.

Proposition 2.1 (My clever proposition). This is a proposition.

Lemma 2.1 (My useful lemma). This is a lemma.

Example 2.1. This is an example.

Proof. This is a proof.

2.7 Equations

2.7.1 Nonumbered Equations

$$U = \underbrace{\int_0^\infty \frac{1}{1 - \sigma} \left(C^{1 - \sigma} - 1 \right) e^{-\rho t} \, \mathrm{d}t}_{\text{meaning of life}}$$

2.7.2 Numbered Equations

$$U = \int_0^\infty \underbrace{\frac{1}{1 - \sigma} \left(C^{1 - \sigma} - 1 \right)}_{\text{instantaneous utility}} e^{-\rho t} dt$$
 (2.1)

2.7.3 Matrix Equations

$$\boldsymbol{A} = \boldsymbol{B} + \boldsymbol{C} \tag{2.2}$$

2.8 Cross-references

- to literature (Bjorvatn & Eckel 2006, pg. 10) or Haufler & Wooton (2006, pg. 10),
- to Figure 2.1,
- see Table 2.1,
- to Section 2.7,

- to Definition 2.1, to Proposition 2.1, Example 2.1,
- to equations like this: see (2.1).

2.9 Source codes

You can input a source code like this:

```
omega = 1;
syms zeta;
jmn = [1 2*zeta*omega omega^2];
figure(1);
    for zeta = 1E-5 : 0.2 : 1+1E-12
        G = tf(omega^2,subs([1 2*zeta*omega omega^2]));
        bode(G); hold on;
end
legend('\zeta = 0','\zeta = 0,2','\zeta = 0,4','\zeta = 0,6',');
```

Should you prefer a different font size, redefine file Styles/Mystyle.sty.

2.10 Hints

- Don't give orders—don't write in the imperative mood—unless you are training to be a teacher.
- Avoid the use of questions. You may know the answer: does your reader? It's much safer to tell her, or him.
- Do not become entangled in the problems of 'sexist' language. It is much easier to write in the plural. "Students should check their work" is good English. "A student should check—" is also good English, but now the problems begin: "—her work"? "—his work"? Which? You can write "his or her", but that seems clumsy. Stick to the plural.
- If you must refer to yourself, third person formulae such as "The present writer would recommend that ..." may be useful.
- Use the full forms of words and phrases, not contractions like "he's", "don't", etc. Keep the apostrophe to indicate possession—and use it correctly. Academics really sneer at students who use the "Greengrocer's apostrophe".

Title of Chapter Three

3.1 Title of Section One

Usually you should not use the first person singular (I) in your text, write we instead. As a general recommendation, use the first person sparsely, sometimes it can be replaced by a phrase like "This work presents ...".

3.2 Hints

- Use as few words as you can; but use enough words to express your meaning as fully as you can. Your judgment of what is appropriate here is part of what you should learn throughout your course.
- Avoid lazy words such as "nice". It is usually better to say "acquire" or "obtain" than "get"; and it may be better, if you mean "through the use of money", to say "purchase" or—better still—"buy".
- A short word like "buy" is better than a long one like "purchase"—unless the long one is more accurate. A "statutory instrument" is better than a "rule"—to a lawyer, at any rate.
- Proof-read with care. Ask someone else to help—you may be too close to your work to be able to see your mistakes.
- If in doubt, choose the more formal, or possibly just the more old-fashioned, of two words. For example, say quotation rather than quote whenever you mean the use of somebody else's words.

Title of Chapter Four

4.1 Title of Section One

It ought to be the happiness and glory of a representative to live in the strictest union, the closest correspondence, and the most unreserved communication with his constituents. Their wishes ought to have great weight with him; their opinion, high respect; their business, unremitted attention. It is his duty to sacrifice his repose, his pleasures, his satisfactions, to theirs; and above all, ever, and in all cases, to prefer their interest to his own. But his unbiased opinion, his mature judgement, his enlightened conscience, he ought not to sacrifice to you, to any man, or to any set of men living. These he does not derive from your pleasure; no, nor from the law and the constitution. They are a trust from Providence, for the abuse of which he is deeply answerable. Your representative owes you, not his industry only, but his judgement; and he betrays, instead of serving you, if he sacrifices it to your opinion.

4.2 Hints

- You will often sound more academic if you include doubts in your work—and qualifications. "Within the scope of this thesis, the current writer cannot hope to cover all the possible implications of the question."
- In this context, the use of litotes sounds very academic. This is the construction where a writer uses a negative with a negative adjective, e.g. "It is not unlikely that ...". This does not mean the same as "It is probable that ...". It has a shade of meaning and qualification that can be useful to academic writers.

Title of Chapter Five

5.1 Title of Section One

The following checklist should help in avoiding some frequently made mistakes, if any of the following propositions apply for your thesis, there is a problem:

- You have citations in your abstract.
- The introduction does not cover the three parts as described above.
- The introduction contains subheadings.
- You described different aspects than promised in the title.
- You copied some parts of the text from other work without proper referencing and citing.
- You used automatic translation tools to produce text by translating it from another language.
- Your thesis contains many typos and grammatical errors. (Use an electronic spell checker. Please!)

- You used color in your figures and refer to the "blue" line (assume that your readers use a monochrome printer).
- You mainly used websites and other unrefereed material as your sources or you used Wikipedia as your source.
- You cite some in your conclusion which you have not mentioned before.
- Some forenames in the references are abbreviated, some not.
- Some references miss a publishing date.

Title of Chapter Six

6.1 Title of Section One

If you write in English, you might find the following hint useful: The indefinite article a is used as an before a vowel sound—for example an apple, an hour, an unusual thing, an MNC (because the acronym is pronounced Em-En-See). Before a consonant sound represented by a vowel letter a is usual—for example a one, a unique thing, a historic chance.

- (i) The first item, the first item, the first item, the first item, the first item,
- (ii) and the second item.
- (a) The first item, the first item, the first item, the first item, the first item,
- (b) and the second item.

6.2 Hints

- Do not despise short, workmanlike, and effective plain English words. If they mean what you want to say. Accurately.
- Avoid the use of humor in academic writing—unless you are very sure of yourself.
- Even when you are not being funny, avoid the use of irony or sarcasm.
- Paragraphs in academic English should contain more than one sentence. (Short paragraphs look as if you are writing for a tabloid newspaper—or a simple Template!) I guess that the average academic book runs to two or three paragraphs per page. Look at the books in your subject, and get a feel for how long your own paragraphs should be when you are imitating the academic style.
- Use the word that more in formal writing than most of us do in speech—particularly after such verbs of utterance as to say, to report, to think etc. It can help to make your writing much clearer.
- Develop an academic vocabulary. The 'long words' you learn in the course of your studies are long usually because they have more precise meanings than their less formal equivalents. They are therefore better when you want to be accurate. (Also they allow you to sound like someone who deserves a degree.)

Conclusion

The conclusion should briefly summarize the problem statement and the general content of the work and the emphasize on the main contribution of the work.

When writing the conclusion keep in mind that some readers may not have gone through the whole thesis, but have jumped directly to the conclusion after having read the abstract in order the decide on the personal relevance of the thesis. Therefore, the conclusion should be self contained, which means that a reader should be able to understand the essence of the conclusion without having to read the whole thesis.

The conclusion typically ends with an outlook that describes possible extensions of the presented approaches and of planned future work.
